# Corn is down, but still popular

Over the last couple of years, dryland corn production has taken it on the chin. The drought has it on the chin. The drought has decreased yields and given corn a bad name with some. However, producers still have some varying degree of interest in the crop and ways to improve production.

One of the major costs of corn production is nitrogen. Many questions arise in no-till production about what is the best time to apply nitrogen and what is the best method of application.

To answer these questions a study funded by the Fluid Fertilizer Foundation and Kansas Fertilizer Research Fund was initiated at five locations in Norton, Rawlins, Thomas, Wallace, and Greeley counties. Application methods of broadcast, surface dribble, and sub-surface injected were used at the application timings of pre-plant, pre-emergence, and after planting to apply 0, 30, 60, 90, and 120 lbs of nitrogen/A. Droughty conditions decreased the utility of the information, but there was some useful information obtained.

early pre-plant application of nitrogen produced greater early growth at 50% of the sites, with a trend towards more growth at the bolson@oznet.ksu.edu if you other sites. A broadcast nitrogen have any questions or would like application produced greater early to see a newspaper article on a speseason growth than injected nitro- cific crop production topic.

Brian Olson, K-State agronomist

gen at two sites, while at the other sites there was no difference in plant growth due to application method.

This study did not yield the amount of useful information it could have if weather conditions would have been better, but it will be continued for the next couple of years. If there are producers willing to cooperate with K-State on this project by allowing us the use of the land, please call me at 785-443-1264. I would like to have two sites in our area.

If you would like a copy of the results, please download "Nitrogen Management for No-till Dryland Corn in the Central Great Plains" by clicking on the icon Block 2 Yield Results at the Web Although yields were low, an site: www.oznet.ksu.edu/agronomy-block2, or a copy can be acquired at your local extension office. Please e-mail me at

# Fall most common agriculture accident

Falls are the most common accident in agriculture accounting for as many as one-third of all farm injuries.

Falls happen quickly and unexpectedly.

For older farmers, falls are especially troublesome. Safety experts estimate that one in three Americans over the age of 65 suffer a fall each year.

Winter signals the beginning of a particularly hazardous time for falls on the farm. To help minimize the risks, here are several rec- trances, stairs and walks. ommendations.

### By ERIN MANNING, executive director

Some of my favorite childhood memories with my family include ent. It's a positive experience for joking around after supper, playing cards or board games, and attending countless sporting events.

For children enrolled in the Big Brothers Big Sisters program, being matched with a mentor could be as simple as enjoying those same activities with an adult role model.

One main goal of January's National Mentoring Month is to raise awareness of mentoring.

Traditionally when people think of Big Brothers and Big Sisters, they think of men — big brothers -mentoring boys and womenbig sisters — mentoring girls. Many people are not aware that couples and families can volunteer

Couple matches consist of husband and wife volunteers. Many volunteers do not have children of their own or their children are grown. As a couple, you can choose to match with either a boy or girl.

Family matches consist of a right here in Norton County. couple volunteer with children. The whole family chooses to mentor a child

For many little brothers and sisters, couple and family matches

are ideal. The majority of children enrolled in the program have little or no contact with an absent parthese children to be part of a family. Enjoying simple activities such as eating supper together, playing games and joking around are important to them.

As with any match, volunteers select a child who will work well with them. Part of the volunteer process includes discussing preferences on age, comprehension level, home situation, activities and interests.

For families, it's important to consider which little brother or sister would work well with their own children.

Big brothers and sisters come from different backgrounds. Some are in high school, and some are retired. They may be traditional or they may be couple or family matches. Despite any differences they may have, all volunteers share one common goal. They want to make a difference in the life of a child.

You could mentor for a child

Articles on mentoring will appear throughout January in honor of National Mentoring Month. For more information regarding the program, call 874-4200.
