CHEYENNE COUNTY wheat plot south of Wheeler showed good stands of wheat on Wednesday, June 15. Dr. Jim Shroyer, K-State agronomist, left, answered some of the wheat questions asked by Spencer Schlepp, county farmer, and Jeanne Falk, K-State agronomist. One of the owners of the plot, Tom Smull, checked out some of the other wheat.

# Many area farmers attend the annual wheat plot tour

By Karen Krien

karen.k@nwkansas.com

About 60 farmers gathered at the K-State wheat plot tour on the Sunny Crest Farm south of Wheeler Wednesday afternoon. It was hot and the wind was blowing but that didn't deter the people from coming.

This has been an unusual year with cooler and wetter weather than normal. Consequently, there are different conditions for the test wheat plot. Additionally, profile moisture also played a big role in wheat growth this year.

The general consensus was the test plot looked very good. Jim Shroyer, K-State agronomist, said, while the plots looked good, they didn't look quite as estimated that the wheat in the plots would average 60 to 70 bushels per acre. Last year, the wheat had averaged 82 bushels per acre.

Jeanne Falk, K-State multicounty agronomist, had planted TAM 111.

Dr. Shroyer, talked about the varieties planted, giving a short history of each type of seed, along with it's strengths and weaknesses to environmental conditions and diseases. Varieties planted included: Art, PostRock, SY Gold, TAM 111, Armour, Cedar, Hitch, Smoky Hill, Winterhawk, Everest, Fuller, Jagger, Overley, Bill Brown, Hatcher, Ripper, T-140, T-158, TAM 112 and AP 503

When asked recommendation on the wheat varieties to look at next year, the speaker told producers to think about their management systems. One way is to choose varieties that have a level resistance to many diseases, including stripe Those varieties include TAM 111, Winterhawk, and Armour. However, producers need to keep in mind that stripe rust may not be a disease that is present every year.

Another way is to choose a variety that has a good yield history in variable environmental conditions (ie drought), but has

stripe or leaf rust. By doing this, producers know they may need to spray for these diseases in some years. These tend to be varieties that have a good yield history and producers feel comfortable planting. varieties include PostRock, Fuller, and TAM 112.

Last year, the wheat yielding the highest in the test plot was Winterhawk with 96.4 bushels per acre. Coming in second was TAM 111 with 94.7 bushels.

Jeanne said she had checked a number of fields after calls asking about wheat streak mosaic. To control wheat streak mosaic, she said, is to control the volunteer wheat. The wheat good as they did last year. He curl mite moves the wheat streak mosaic virus and lives in volunteer wheat. The worst case scenario for infections of wheat streak mosaic is to spray volunteer wheat less than 2 weeks before planting. In this Greenline in Wheeler where case, the volunteer wheat is they enjoyed supper provided by 20 varieties and a seeding rate dying just as the new wheat is the county grain dealers. study with 35 to 75 lbs/ac of emerging. This causes the wheat curl mites to move directly into harvested, the results of yields and transfer the virus into the will be printed in The Saint new wheat.

Alan Schlegel, agronomist at Times.

some level of susceptibility to the K-State Research Center in Tribune, also spoke at the wheat plot tour. He discussed three long term studies at Tribune addressing tillage systems and crop rotations. He said in a 3-year rotation, a complete no-till system had the best yields for the summer crop. However, one of the challenges with this system is getting wheat established and a good stand. They are addressing this challenge with a study looking at limited shallow tillage just prior to wheat planting.

Finally, Jeanne asked what producers would like to see in the test plot next year. This plot is set up to be a place to address producer questions and learn how wheat responds in our own backyard. If you have ideas, please contact Jeanne or the Extension Office.

Following the wheat plot tour, farmers went to Goodland

When the wheat test plot is Francis Herald and Bird City

### Infants/toddlers get help from donations

Tiny-k Infant and Toddler services supports. is participating in a Bushels for Babies" campaign for harvest this year. The program allows farmers a variety of services including: hearing, nutrition, speech and other developmental with identified special needs.

It is easy! Simply notify the grain merchandiser at settlement time that you want to donate "x" to donate grain to help better number of bushels to your local serve area families with infants or tiny-k network and the elevator toddlers who have developmental operator will do the rest. Your delays by enhancing access to tiny-k network is a not-for-profit organization committed to quality service for infants and toddlers
